# Introduction

In axial piston pumps, the pistons reciprocate parallel to the axis of rotation of the cylinder block. The simplest type of axial piston pump is the swash plate in-line design.

The cylinder block in this pump is turned by the drive shaft. Pistons fitted to bores in the cylinder block are connected through piston shoes and a shoe plate, so that the shoes bear against an angled swash plate causing the pistons to reciprocate. The ports are arranged in the valve plate so that the pistons pass the inlet as they are pulled out and pass the outlet as they are forced back in.

The displacement of axial piston pumps is determined by the size and number of pistons, as well as the stroke length which is determined by the angle of the swash plate.

Variable Displacement Piston Pumps are used in closed loop systems either as a single or tandem pump. Oil is circulated by the pump to the motor and then returned directly back to the pump. A charge supply is used to supplement the closed loop system with oil. The charge supply may be supplied by an internal charge pump (standard) or an external source.

## Typical applications

### Harvester equipment

- Combines
- Fruit or vegetable pickers
- Swathers

### Forestry equipment

- Log skidders
- Bark removers
- Limb removers

### Construction equipment

- Trenchers
- Skid steer loaders
- Utility vehicles
- Sweepers

### Turf care equipment

- Mowers

### Paving equipment

- Rollers
- Packers

### Industrial equipment

- Lift trucks
- Scissor lifts

# Manual control pumps

## 70160 Series

- 20.3 cm<sup>3</sup>/r [1.24 in<sup>3</sup>/r]
- 21.6 cm<sup>3</sup>/r [1.32 in<sup>3</sup>/r]
- 23.6 cm<sup>3</sup>/r [1.44 in<sup>3</sup>/r]

## 70360 Series

- 35.1 cm<sup>3</sup>/r [2.1 in<sup>3</sup>/r]
- 40.6 cm<sup>3</sup>/r [2.48 in<sup>3</sup>/r]
- 49.2 cm<sup>3</sup>/r [3.00 in<sup>3</sup>/r]

## Features and benefits

### A Housing

- Compact
- Lightweight, die cast aluminum

### B Rotating kit

- 20.3 to 49.2 cm<sup>3</sup>/r [1.24 to 3.0 in<sup>3</sup>/r] displacements

### C Swash plate

- With swash position sensor (on 70360)

### D Valve plate

- Reduces noise & swash plate moments
- Improves mechanical efficiency
- Improved serviceability

### E Ge-rotor charge pump

- 6.9 cm<sup>3</sup>/r [.42 in<sup>3</sup>/r]
- 10.3 cm<sup>3</sup>/r [.63 in<sup>3</sup>/r]
- 13.8 cm<sup>3</sup>/r [.84 in<sup>3</sup>/r]
- 17.2 cm<sup>3</sup>/r [1.05 in<sup>3</sup>/r]
- 20.7 cm<sup>3</sup>/r [1.26 in<sup>3</sup>/r]

### F High pressure relief valve

- 104 to 350 bar [1500 to 5500 psi]

### G Charge pump housing w/ auxiliary mount

- SAE A or B
- To mount additional pump

### H Bypass valve

- For cross porting & towing to a limited distance

# Servo controlled

## 72400 Series

- 40.6 cm<sup>3</sup>/r [2.48 in<sup>3</sup>/r]
- 49.2 cm<sup>3</sup>/r [3.00 in<sup>3</sup>/r]

## Features and benefits

- A Housing**
  - Compact
  - Durable cast iron design
  - Multiple drain options
  - Improved serviceability
- B Rotating group**
  - 40.6 cm<sup>3</sup>/r [2.48 in<sup>3</sup>/r]
  - 49.2 cm<sup>3</sup>/r [3.00 in<sup>3</sup>/r]
- C Manual displacement servo control valve**
  - Low operator effort.
  - Modular design
- D Valve plate**
  - Quieter operation
  - Improved serviceability
  - Improves mechanical efficiency
- E Ge-rotor charge pump**
  - 6.9 cm<sup>3</sup>/r [.42 in<sup>3</sup>/r]
  - 10.3 cm<sup>3</sup>/r [.63 in<sup>3</sup>/r]
  - 13.8 cm<sup>3</sup>/r [.84 in<sup>3</sup>/r]
  - 17.2 cm<sup>3</sup>/r [1.05 in<sup>3</sup>/r]
  - 20.7 cm<sup>3</sup>/r [1.26 in<sup>3</sup>/r]
- F End cover with main ports on**
  - Same side
  - Opposite side
- G Charge pressure relief valve**
- H Auxiliary pump mounting flange**
  - SAE "A" or "B"
- I Bypass valve**
  - For cross porting & towing to a limited distance
- J High pressure relief valve**
  - 104 to 350 bar [1500 to 5500 psi]

# Model code - Single pump

## 70160 Series

The Model 70160 variable displacement piston pumps are specified by the following model code. Once a pump is built from the model code, a product number will be assigned to that configuration.

Make sure all positions are selected within the 32 digit code for each pump.

**ADB** - Series 70160 manually variable displacement axial piston pump with SAE J744 flange 82-2 (2 Bolt A)

All left (CCW) or right (CW) directions given are viewed from the input shaft end of the pump

# Model code - Single pump

## 70360 Series

Ordering Instructions: The Model 70360 piston pumps are specified by using the following model code system tailoring the pump configuration to the requirement. Once a pump is built from the model code, a product number will be assigned to that configuration and the pump identified.

Make sure all positions are selected within the 25 digit code for each pump order. Also state if the pumps making up a tandem are required to be mounted together or separately.

**ACV** - Series 70360 manually variable displacement axial piston pump

All left (CCW) or right (CW) directions given are viewed from the input shaft end of the pump

# Model code - Single pump

## 72400 Series

Ordering Instructions: The Model 72400 Servo Controlled piston pumps are selected by using the following Model Code System tailoring the pump configuration to the requirement. Once a pump is built from the model code, a product number will be assigned to that

configuration and the pump identified.

Make sure all positions are selected within the 27-digit code for each pump ordered.

**AAD** - 40.6 cm<sup>3</sup>/r [2.48 in<sup>3</sup>/r] Series 72400 servo controlled variable displacement axial piston pump

**AAE** = 40.6 cm<sup>3</sup>/r [2.48 in<sup>3</sup>/r] servo controlled variable displacement pump (tandem front pump)

**AAF** = 40.6 cm<sup>3</sup>/r [2.48 in<sup>3</sup>/r] servo controlled variable displacement pump (tandem rear pump)

**ACG** - 49.2 cm<sup>3</sup>/r [3.00 in<sup>3</sup>/r] Series 72400 servo controlled variable displacement axial piston pump

**ACH** = 49.2 cm<sup>3</sup>/r [3.00 in<sup>3</sup>/r] Servo controlled variable displacement pump (tandem front pump)

**ACJ** = 49.2 cm<sup>3</sup>/r [3.00 in<sup>3</sup>/r] servo controlled variable displacement pump (tandem rear pump)

## Single pumps

### 70160/70360

Schematic for direct manual controlled pump with integral charge pump, bypass valve and auxiliary ports

### 72400

Schematic for servo controlled pump with Electronic proportional control, bypass valve, charge pump and auxiliary ports.

A, B	Main pressure ports
C1, C2, C3	Auxiliary ports
D1, D2	Drain ports
P	Control supply orifice (optional)

R1, R2	High pressure relief valves
R3	Charge/low pressure relief valve
S1, S2	Control servo orifice (optional)

## Multiple pumps

### Tandem pumps

Two or more piston pumps mounted in series (one behind the other) are called as tandem pumps. The first pump is called as front of tandem & second pump as rear of tandem. These pumps can be used as single pumps in isolation with necessary mounting / shaft interface. Auxiliary piston / gear pumps can be added as per requirement

### Back to Back pumps

When two piston pumps are mounted such that their rotating kits are facing each other, such arrangement is called as back to back arrangement. These pumps share same center manifold which includes the flow paths and high pressure ports for both front and rear pump. Back to back pumps works as a single unit and front / rear pump cannot be separated. Auxiliary piston / gear pumps can be added as per requirement.

**Hydraulic pilot control (HA)**

**Manual control (MF)**

# Electronic Proportional displacement control

The Electronic Proportional (EP) displacement control is ideal for applications requiring electronic pump displacement control. The EP displacement control provides the flexibility of three command input choices. Control components include a proportional solenoid actuated valve assembly and an electronic solenoid driver module mounted on the pump.

The EP displacement control has been designed to withstand the rigors of off-highway equipment environmental conditions.

## EP displacement control features

- Ease of installation
- Automotive style environmentally sealed Metri-pack connectors
- Operates from 12 or 24 Vdc power supply
- External fuse (customer supplied): 3A for 12 Vdc system, 1A for 24 Vdc system
- Three choices for command input signal
- Operating temperature range -40° C to +85° C
- Closed loop current control compensates for resistance change of the proportional solenoids due to temperature variations
- Return to neutral for loss of power, or loss of command input signal
- Mechanical feedback of swashplate position for closed loop control
- External neutral adjustment
- Manual override capability
- SAE J1455 - Recommended environmental practices for electronic equipment design
  - Humidity/temperature extreme cycling
  - Salt spray
  - Splash & Immersion
  - Steam cleaning/high pressure wash
  - Vibration
  - Mechanical shock
  - Temperature cycling
  - Load dump transients
  - Inductive load switching transients
- SAE J1113 - Electromagnetic susceptibility measurement procedures for vehicle components
  - EMI/EMC - Conducted & radiated immunity
- CISPR 25 - International electrotechnical commission "Limits and methods of measurement of radio disturbance characteristics for the protection of receivers used on board vehicles"
  - EMI /EMC - Conducted & radiated emissions

## Signal profile

## PWM configuration

Closed loop current control of the solenoid current via PWM duty-cycle variation.

Note: Coil currents must be limited to not exceed solenoid coil specifications

Frequency: 70-200Hz

(100Hz recommended when PWM driver does not have built-in dither capabilities)

## Dither signal

The design must provide for a separate dither signal to be added to the input command.

Waveform: Square

Frequency: 75 (+ 25,-15) Hz

Amplitude: .250 ±.100 -.050A pk-pk

# Solenoid operated controls

# Solenoid control with swash feedback sensor

(SK)

This control has additional swash position sensor which provides angular position of the swash plate very precisely at any point of time during pump operation. Swash position signal is converted in electrical signal and supplied to Electronic Control Unit (ECU) of the hydraulic system. This signal is used to compare the input command to the pump and the output flow. Any deviation in the demand Vs pump output flow is corrected by electric signal from ECU to solenoids which in turn will stroke or de-stroke the pump to match the flow.

Refer Swash sensor section for further details.

# Hydraulic remote control

(HA)

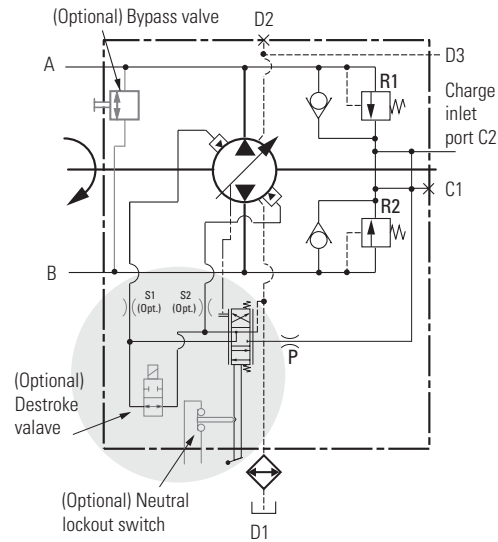

## Hydraulic remote control conversion kit

Order part number 72400-919

Includes: Control sub-assembly (1pc), Socket head cap screws (6 pc), Control housing gasket (1pc)

# Manual control

Torque required to move manual control lever – 4.52 N-m [40 lbf-in]

Control Lever Travel	Standard Band	Wide Band	High Gain
Neutral Zone	2.5°	4.0°	3°
Maximum Displacement	25.5°	25.5°	17°
Maximum Over Travel	4.0°	2.5°	10°

## Neutral detent feature (MB)

The neutral detent provides a positive, centered feeling to the handle, signaling the operator when the pump is in neutral position.

## Neutral lockout feature (MA, MF, MG, MJ, MS)

The neutral lockout switch consists of an electrical switch installed on the controller. This switch closes at the neutral position of the input lever and opens if lever is rotated either direction. The electronic "lockout" prevents the operator from starting any auxiliary functions unless the pump is in neutral position.

Dimensions are in millimeters [inches], unless otherwise specified.

## Destroke valve feature

The destroke valve provides an emergency return to neutral and must be energized in order for the pump to stroke. If at any time power is interrupted to the solenoid, the pump will destroke to neutral.

# Pump additional features

## Brackets

70160

### Code "AF" bracket

### Code "AG" bracket

70360

## Bleed-off valve

### Pump with integral charge

Bleed-off valves are used to bleed oil from the low pressure side of the loop. They are "normally open" valves which close when pressurized to 200-250 psi. These valves close and open abruptly, causing vehicles to lurch when operators move across neutral into

the opposite direction. As designed, a bleed-off valve can withstand flows of .8 to 1.2 gpm. Increasing the flow capacity of the valve will magnify the lurch that operators experience.

### Bleed off-valve - normal open position

### Bleed off-valve - closed position

# Pump additional features

## Bypass/dump valve

(For dimensions, refer to installation drawings.)

Opens the closed loop hydraulic circuit, allowing limited movement of a machine.

Part # to order Bypass/dump valve separately  
 70160 & 70360 = 70300-610  
 72400 = 72400-900

### Case 1:

Bypass/dump valve in normal condition (Towing is not permitted)

### Case 2:

Bypass valve in actuated condition.

ie valve is turned to 90° (either side) which allows to open two HPRV spool & hence both the ports are connected to each other and towing to a short distance is permitted in this condition.

Bypass valve is in normal condition. (flat is parallel to shaft axis) Towing is not permitted

When Bypass valve is rotated by 90° (flat becomes perpendicular to shaft axis) Towing is permitted

Note: Valve could be rotated by 360°. For towing operation 90° (either side) rotation is required.

# Pump additional features

# Pump additional features

## Swash position sensor

- The swash feedback sensor enables the system to accurately signal the swash position and provide input to Electronic Control Unit (ECU).
- This signal can be used by ECU to indicate pump neutral/stroking position to operator & to actuate any auxiliary attachment/ implement on vehicle.
- Pump neutral signal can be used as safety mechanism that avoids accidental start of engine / implement when the pump is in stroke.

### For 70360 pump

#### Technical specifications

Input voltage	5 ± 0.5 VDC
Input current	11 mA (Redundant Sensor)
Input current	22 mA (Non -Redundant Sensor)
Output voltage	2.5 ± 0.01 VDC
Temperature range	-40 °C to 120 °C

### For 72400 pump

#### Technical Specifications

Input voltage	5 ± 0.5 VDC
Input current	10 mA
Output voltage	2.5 ± 0.01 VDC
Output current	-1 to 1 mA
Sensitivity	1.0 volt per 10° shaft rotation
Temperature range	-40 °C to 120 °C

#### Connector

#### Mating Connector

#### Harness Length (inch)

Delphi packard weather pack- 3 way connector (Shroud)	Delphi packard weather pack- 3 way connector (Tower)	5.25 ± 0.50

# Pump additional features

## Speed sensor

Magnetic speed sensor is used to measure the speed of the drive shaft. This is optional feature. Cylinder barrel has cutouts made on its periphery. Magnetic speed sensor senses the speed of these cutouts and converts it into required RPMsignal. This does not sense the direction of rotation of the pump.

## Mating packard connector

Connector body – 1216 2192  
 Connector seal – 1204 0750  
 Cable seal – 1204 0751  
 Socket – 1212 4075

## Optional mating connectors

Connector assembly (body, cable seal, seal) – 1216 2193  
 Socket (16 – 18 AWG) – 1212 4075  
 Socket (20 – 22 AWG) – 1212 4076

Condition	Condition	Value
Operating temperature limit		-40 to 150°C [-40 to 302°F ]
Sensor resistance	25°C (77°F)	1.5 K To 3.5 K Ohms
Sensor inductance	25°C (77°F)	0.6 to 3.7 H
Output voltage	25°C (77°F) 9.3 Hz @ 2.29mm [.090 inch] gap 300 Hz @ 0.25mm [.010 inch] gap	400 mVpp min 80 Vpp max.
Air gaps		0.26 to 2.28 [ .010 to .090 ] mm [inch]
Vibration voltage	15G random vibration	0.4V P-P Max

# Pump additional features

## Adjustable displacement limiter on model 72400

- Externally adjustable displacement
- Settings are zero to maximum pump displacement
- Independent adjustment for both main ports
- Field adjustable
- Available in kit form (see page 62)

All factory units shipped with adjustable stops are set at maximum pump displacement.

See re-adjustment instructions below.

### To calculate displacement required

The displacement required divided by displacement of one turn of set screw equals the number of turns of set screw to obtain displacement.

Example for 3.00 in<sup>3</sup>/r re-adjustment:

$$2.0 \text{ in}^3/\text{r} \div .2854 \text{ in}^3/\text{r} = 7 \text{ turns of set screw}$$

### To re-adjust displacement

- Loosen nut on adjustable see screw #81 servo stop. Screw stop in until it touches the servo piston. Back the screw out (number of turns required) to obtain the flow required. Refer to chart for displacements. Lock adjustment with nut. Torque nut 8 to 11 N·m [68 to 96 lbf·in]
- Loosen nut on adjustable set screw #74 servo stop. Screw stop in until it touches the servo piston. Back the screw out (number of turns required) to obtain the flow required. Refer to chart for displacements. Lock adjustment in place with nut. Torque nut 17 to 18 N·m [150 to 160 lbf·in]

# Pump additional features

## Adjustable displacement limiter kit

### Field installed kits

- One side ..... Kit #72400-938
- Two sides ..... Kit #72400-940

### Disassembly

- Remove the four cap screws (Item #7) and washers (Item #61) retaining the existing cover plate (Item #11) opposite neutral set screw
- After removing existing cover plate (Item #11) and cover gasket, measure the distance from the servo piston to the surface of housing for reference for neutral setting
- Remove neutral setting nut (Item #2)
- Remove the four cap screws retaining the existing cover plate (Item #17)
- The cover plate (Item #17) is screwed onto the servo piston bolt. When removing the cover plate, count the amount of turns it takes to remove cover for reassembly. Also remove existing gasket (Item #12)

### Installing servo stops

- Place new gasket (Item #12) onto the housing on the neutral setting screw side of the servo piston. Hold in position with a small amount of petroleum jelly
- Screw new cover plate (Item #17) onto servo piston bolt the same number of turns as it took to remove it. Install the four cap screws (Item #7) and washers (Item #61) to retain cover plate. Torque 4.5 to 5.4 N·m [40 to 48 lbf·in]
- Install seal washer (Item #6), washer (Item #60) and jam nut (Item #2). Torque nut 17 to 18 N·m [150 to 160 lbf·in]. At this time, check the distance from the servo piston to housing surface on opposite side. It should be the same as previously measured at disassembly. If not the same, loosen jam nut and with a hex key wrench, adjust and retorque nut
- Install new cover plate (Item #11) and retain with four cap screws (Item #7) and washers (Item #61). Torque 4.5 to 5.4 N·m [40 to 48 lbf·in]
- Insert adjustable servo stop set screw (Item #81) in until it touches the servo piston. Back the screw out to obtain the flow required. Refer to chart for displacements. Lock adjustment into place with seal washer (Item #83), washer (Item #82), and jam nut (Item #80). Torque nut 8 to 11 N·m [68 to 96 lbf·in]
- Insert adjustable servo stop set screw (Item #74) in until it touches the servo piston. Back the screw out to obtain the flow required. Refer to chart for displacements. Lock adjustment into place with seal washer (Item #6), washer (Item #60), and jam nut (Item #2). Torque nut 17 to 18 N·m [150 to 160 lbf·in]

# Features and port sizes

## Model 72400

### Drain locations in rear of pumps

### Side and front of pump

\*Note: Auxiliary port required in rear and front pump of tandem to provide charge flow and pressure to front pump.

All left (CCW) or right (CW) directions given are viewed looking at the input shaft end of the pump.

(For dimensions, refer to installation drawings.)

# Features and port sizes

## Model 72400

Charge pump position must stay in relationship to backplate as pictured below.

### \*Righthand rotation (CW)

### \*Lefthand rotation (CCW)

\*All left (CCW) or right (CW) directions given are viewed looking at the input shaft end of the pump.

(For dimensions, refer to installation drawings.)

# Features and port sizes

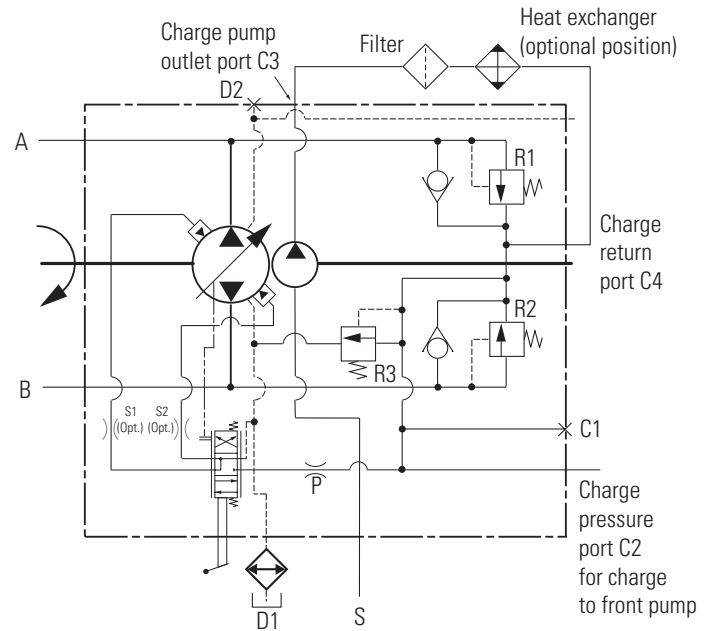

## Model 72400 charge pump routing and location

### Standard pump

### Charge pump with remote filter/ heat exchanger ports

(Filter and heat exchanger supplied by customer.)

### Charge outlet port location

The charge outlet and return port is located in the charge pump housing, opposite of the suction port and charge relief valve.

For further detail on port relationship to rotation and position, refer to installation drawings.

All left (CCW) or right (CW) directions given are viewed looking at the input shaft end of the pump.

# Component selection

The long service life of Eaton hydrostatic transmissions is largely dependent on the proper selection and installation of the components necessary for transmission operation.

The following components are necessary for transmission operation:

- Variable displacement pump
- Fixed or variable displacement motor
- Reservoir
- Filter
- Charge pump inlet line
- Pump and motor case drain lines
- High pressure lines
- Heat exchanger
- Heat exchanger bypass valve
- Reservoir return line

## Variable displacement pump

Eaton hydrostatic variable displacement pumps are an axial piston design. They are equipped with standard SAE mounts, shafts and port connections.

## Fixed or variable displacement motor

Eaton hydrostatic motors are an axial piston design. They are equipped with standard SAE mounts, shafts and port connections.

## Sizing equations

For sizing/selecting the right pump for your application please carryout following basic calculations.

Flow requirements

Pump flow rate

$$\text{Pump displacements (DP)} = \frac{N_m \times D_m}{N_p \times \eta_p (\text{vol.}) \times \eta_m (\text{Vol.})}$$

Where,

N<sub>m</sub> = Necessary loaded motor speed (RPM)

D<sub>m</sub> = Motor displacement (in<sup>3</sup>/rev )

N<sub>p</sub> = Pump input speed (RPM)

η<sub>p</sub> (vol.) = Pump volumetric efficiency

η<sub>m</sub> (vol.) = Motor volumetric efficiency

$$Q (\text{gpm}) = \frac{\text{Pump displacement}(\text{in}^3/\text{rev}) \times \text{Speed (rpm)} \times \eta (\text{vol. eff.})}{231}$$

$$\text{Pump input power (HP)} = \frac{\text{Flow rate out put (GPM)} \times \text{Pressure (psi)}}{1714 \times \eta (\text{overall})}$$

Torque

$$\text{Torque (lbf-in)} = \frac{\text{Pump displacement (in}^3/\text{rev)} \times \text{Pressure (psi)}}{(2 \times \pi) \times \eta (\text{mech. eff.})}$$

## Charge pump displacement

$$D = \frac{0.156 (n_p \times D_p + n_m \times D_m)}{2}$$

D<sub>cp</sub> = Charge pump displacement

n<sub>p</sub> = Number of pumps

n<sub>m</sub> = Number of motors

D<sub>p</sub> = Pump displacement

D<sub>m</sub> = Motor displacement

## Reservoir

The reservoir is an important part of the hydrostatic transmission system. It should provide adequate oil storage and allow easy oil maintenance.

The reservoir must hold enough oil to provide a continuous oil supply to the charge pump inlet. It must also have enough room for the hydraulic oil to expand as the system warms up. Consider charge pump flow when sizing the reservoir: One half (.5) minute times (X) the maximum charge pump flow should be the minimum oil volume in the reservoir. Maintaining this oil volume will give the oil a minimum of thirty (30) seconds in the reservoir. This will allow any entrained air to escape and contamination to settle out of the oil.

To allow for oil expansion, the reservoir's total volume should be at least six tenths (.6) minute times (X) the maximum charge pump flow.

The reservoir's internal structure should cut down turbulence and prevent oil aeration.

The line returning flow to the reservoir should be fitted with a diffuser to slow the incoming oil to 1 to 1.2 meters [3-4 feet] per second to help reduce turbulence. The return flow line should also be positioned so that returning oil enters the reservoir below the liquid surface. This will help reduce aeration and foaming of the oil.

The reservoir should have baffles between the return line and suction line. Baffles prevent return flow from immediately reentering the pump.

A sixty mesh screen placed across the suction chamber of the reservoir will act as a bubble separator. The screen should be placed at a 30° angle to the horizon.

The entrance to the suction line should be located well below the fluid surface so there is no chance of air being drawn into the charge pump inlet. However, the suction line entrance should not be located on the bottom of the reservoir where there may be a buildup of sediment. The suction line entrance should be flared and covered with a screen.

The reservoir should be easily accessible. The fill port should be designed to minimize the possibility of contamination during filling and to help prevent over filling. There should be a drain plug at the lowest point of the reservoir and it should also have a clean-out and inspection cover so the reservoir can be thoroughly cleaned after prolonged use. A vented reservoir should have a breather cap with a micron filter.

Sealed reservoirs must be used at altitudes above 2500 feet. These reservoirs should be fitted with a two-way micron filter pressure cap to allow for fluid expansion and contraction.

In both cases the caps must be designed to prevent water from entering the reservoir during bad weather or machine washing.

A hydrostatic transmission with a well designed reservoir will run quieter, stay cleaner and last longer.

# Component selection

## Filter

A filter must be used to keep the hydraulic fluid clean. Either a suction filter or a pressure side filter may be used. The filter must be a no-bypass type. System oil particle levels should not exceed ISO 18/15 per ISO 4406. Refer to Eaton hydraulic fluid recommendations.

Recommended filters

Pressure line – 5 micrometer

Suction line = 3 OR 5 micrometer

When a suction filter is used, its flow capacity must be large enough to prevent an excessive pressure drop between the reservoir and charge pump inlet. The pressure at the charge pump inlet port must not be less than 0.80 bar absolute [6 in. Hg.] at normal continuous operating temperatures

## Charge pump inlet line

The inlet line to the charge pump should be large enough to keep the pressure drop between the reservoir and charge pump inlet within the limits described in the filter section. Fittings will increase the pressure drop, so their number should be kept to a minimum. It is best to keep fluid velocities below 1.25 meters [4 feet] per second.

Fluid and temperature compatibility must be considered when selecting the inlet line.

## Pump and motor case drain

The case drain lines should be large enough to limit the pump and motor case pressures (Medium Duty to 2 bar [25 PSI]) at normal operating temperatures. Fluid and temperature compatibility must also be considered when selecting the case drain lines.

## High pressure lines

The high pressure lines that connect the pump and motor must be able to withstand the pressures generated in the high pressure loop.

## Heat exchanger

Use of a heat exchanger is dependent on the transmission's duty cycle and on machine layout. The normal continuous operating fluid temperature measured in the pump and motor cases should not exceed 80°C [180°F] for most hydraulic fluids. The maximum fluid temperature should not exceed 107°C [225°F].

The heat exchanger should be sized to dissipate 25% of the maximum input power available to the transmission. It must also be sized to prevent the case pressures in the pump and motor from getting too high. Medium duty case pressure up to 2 bar [25 psi], at normal operating temperatures, are acceptable.

## Heat exchanger bypass valve

The heat exchanger bypass valve is a pressure and/or temperature valve in parallel with the heat exchanger. Its purpose is to prevent case pressures from getting too high. The heat exchanger bypass valve opens when the oil is thick, especially during cold starts.

## Reservoir return line

The same general requirements that apply to case drain lines apply to the reservoir return line.

## Bearing life estimation

Bearing life is defined as the length of time in terms of revolutions or time until a fatigue failure. Bearing load is calculated as a reaction which is derived from the moment created by the piston side load. Magnitude of the side load directly related to the speed and pressure at which a unit can be operated.

Bearing life is a function of the side loads coming on the bearings. Other factors such as fluid type, viscosity of fluid and cleanliness also affects the life of bearing.

If detail bearing life analysis is required, you can contact Eaton representative.

## Installation requirements

The mounting orientation of pumps and motors is unrestricted provided the case drain of the pump and motor remain full. Position the case drain such that it assures an oil level at or above unit center line at start-up. The case drain line that carries the flow leaving the pump or motor should be connected to the highest drain port on each of the units. This assures that the pump and motor cases remain full.

The combined torque required to turn two or more pumps must not exceed the torque rating of the input drive shaft of the front piston pump. Installer to provide centering and a secure neutral for pump swashplate control shaft. An external support is recommended for all tandems.

## Open loop circuits

Eaton pumps and motors may be used in open loop circuits under certain operating conditions. Consult your Eaton representative for details.

# Hydraulic fluid recommendations

## Introduction

Hydraulic fluids are one of the vital components of hydraulic system. Proper selection of oil assures satisfactory life and operation of system components. The purpose of this section is to provide readers with the knowledge required to select the appropriate fluids for use in systems that employ Eaton hydraulic components

## Viscosity and temperature

Viscosity is the measure of a fluid's resistance to flow. The most important characteristics to consider when choosing a fluid to be used in a hydraulic system is viscosity. The fluid must be thin enough to flow easily but thick enough to maintain adequate lubricating film between components and to maintain proper sealing at the operating temperatures of the hydraulic system.

For viscosity requirements, see table

Viscosity of any fluid is relative to temperature, as the fluid warms the viscosity decreases and vice versa. When choosing a fluid, it is important to consider the start-up and operating temperatures of the hydraulic system. A high VI fluid shows relatively small change of viscosity with temperature.

Lubricants used for hydraulic applications may contain viscosity index improvers (VII). They refer to these fluids as viscosity index improved or multi-viscosity fluids. The viscosity of these fluids may drop down in use due to shearing of VI improvers used in the formulations.

Anti-wear hydraulic oils containing polymeric thickeners, viscosity index improvers (VII) are generally used for wide band operating temperature applications. These fluids experience temporary and permanent viscosity loss during use in hydraulic system. Check the extent of viscosity loss (shear stability) to avoid hydraulic service below the recommended minimum viscosity. Oil with good shear stability is recommended for wide band temperature applications.

Multi-grade engine oils, ATFs, UTTOs, etc., also contain VIIs, and viscosity loss will be encountered during use.

## Cleanliness

Cleanliness of the fluid in a hydraulic system is extremely important. More than 70% of all failures are caused by contamination. Eaton recommends that the fluid used in its hydraulic components be maintained per ISO 4406. Cleanliness level requirements vary with the hydraulic components. The cleanliness of a hydraulic system is dictated by the cleanliness requirements of the most stringent component in the system.

Cleanliness requirements for specific products are given in the table.

OEM's and distributors who use Eaton hydraulic components in their hydraulic systems should provide these requirements in their designs.

Contact Eaton filter representative for filtration information.

## Fluid maintenance

The condition of a fluid has a direct effect on the performance and reliability of the system. Maintaining proper fluid viscosity, cleanliness level, water content, and additive level is essential for excellent hydraulic system performance. Routine fluid condition monitoring is recommended.

## Fluid selection

Premium grade anti-wear (AW) petroleum based hydraulic fluids will provide the best performance with Eaton hydraulic components. Fluids that meet Eaton Hydraulic Fluid Specification E-FDGN-TB002-E are considered good quality anti-wear hydraulic fluids. These fluids pass Eaton Vickers® 35VQ25A high pressure vane pump test (Eaton ATS-373 test procedure, ASTM D 6973).

Automotive crank case oils with American Petroleum Institute (API) letter designation SF, SG, SH, SJ, or higher per SAE J 183 classes of oils are recommended for applications using Eaton DG valves. Automotive crankcase oils generally exhibit less shear stability compared to industrial anti-wear hydraulic fluids, which can result in higher loss of viscosity during service life.

Other mineral oil based lubricants commonly used in hydraulic systems are automatic transmission fluids (ATF) and universal tractor transmission oils (UTTO).

Synthetic hydrocarbon base stocks, such as polyalphaolefins (PAO) are also used to formulate hydraulic fluids, engine oils, ATFs and UTTOs. Alternate fluids are recommended when specific properties, such as fire resistance biodegradability etc., are necessary for the application. Keep in mind that alternative fluids may differ from AW petroleum fluids in properties.

## Additional notes

When choosing a hydraulic fluid, all the components in the system must be considered. Viscosity limitations have to meet the most stringent component requirements.

For any system where the fluid is non-petroleum oil, set the target one ISO code cleaner for each particle size, than that of petroleum fluids.

Keep adequate fluid level in the reservoir. Take fluid level reading when the system is cold.

Contact your Eaton representative, if you have specific questions about the fluid requirements of Eaton hydraulic components.

Shandong Topkit Construction Machinery Equipment Co., Ltd., is a high-tech company specialized in the manufacturing and supplying for hydraulic pumps, valves , motors, reducers, gearboxes, etc.

We mainly focuses on hydraulic parts for hydraulic excavators, and the products have been serialized. We dedicated on the following three systems and five series products. We specialized in Positive flow system, negative flow system, load sensing control system;

Five series refer to 6-ton products, 8-ton products, 20-ton products, 40-ton products, concrete series products.

Our featured products 20-ton excavator negative flow pump, positive flow pump, positive flow valve, and rotary motor passed the national appraisal in 2012.

In quality control, we passed the ISO2001:2015 quality management system certification in 2022; and we also passed the ISO14001:2015 environmental management system certification in this year. We always persist in the quality control and try best to enhance quality all the time.

In R&D Field, we have a professional team with more than 10 people, of which more than 90% have accumulated more than ten years of hydraulic product technology, and have become the main force for the company to develop new products.

Now our products has exported to dozens of countries, such as Russia, Middle East countries, Asian and African countries.

We will continue to develop new products in top quality, and sincerely wish establishing business cooperation with more friends. Thanks
